Tactical Network Penetration Testing & Reconnaissance

Author: TH3HUBRIS (Cybersecurity Engineer & Ethical Hacker)

Classification: Verified Educational Research | Status: Public Access

Chapter 1: Low-Emission Passive & Active Reconnaissance

Effective network auditing begins with minimal footprint reconnaissance. Learn how to map target IP spaces, identify subnets, and extract network boundaries using passive DNS databases and certificate transparency logs.

Chapter 2: Port Scanning & Service Fingerprinting

Techniques for SYN stealth scans, fragmented packet transmission, timing templates (T2/T3), and custom decoy arrays to assess firewall behavior and identify open service listeners without triggering automated rate-limits.

Chapter 3: Vulnerability Assessment & Exploitation Vectors

Systematic enumeration of service versions, TLS certificate cipher weaknesses, SMB/RDP configuration flaws, and verifying exploitable attack surfaces prior to lateral engagement.
