Chapter 1: Operating System Security Baseline

Securing the operator machine is paramount. This module details kernel parameter hardening (/etc/sysctl.conf), disabling unused network protocols, locking file descriptors, and establishing immutable DNS configs.

Chapter 2: Browser OPSEC & Mozilla Enterprise Policies

Web browsers frequently leak device identifiers and DNS queries. By writing system-level policies.json, DNS-over-HTTPS (DoH) is disabled to prevent Cloudflare bypass, and WebRTC is constrained to eliminate internal IP leaks.

Chapter 3: Hardware MAC Spoofing & Network Hygiene

Automated randomisation of network interface identifiers on physical and virtual adapters. Preventing captive portal tracking and local Layer-2 fingerprinting.
