Red Team Operations & Adversary Emulation Framework

Author: TH3HUBRIS (Cybersecurity Engineer & Ethical Hacker)

Classification: Verified Educational Research | Status: Public Access

Chapter 1: Covert Egress & Multi-Hop Pivoting

Advanced adversary tactics for navigating segmented networks. Establishing multi-hop SSH tunnels, dynamic SOCKS5 reverse proxies, and maintaining covert egress routes through restricted perimeter firewalls.

Chapter 2: Credential Access & Lateral Movement

Techniques for harvesting authentication tokens in memory, token manipulation, and executing lateral movement across internal active directory domains with minimal forensic artifacts.

Chapter 3: Counter-Forensic Discipline & Operational Clean-up

Strict procedures for session cleanup, clearing temporary execution artifacts, restoring system states, and verifying zero remaining telemetry on target systems.
